

Software Development for Mobile Devices

Submission for Assignment A2.1P

Task 1. Separation of concerns

Separation of concerns

Separation of concerns is a design principle in which the program is divided into distinct sections (Separation of concerns 2018). The benefit of separation of concerns is to reuse and maintain the program efficiently. In other words, the program is able to extend and update without causing any major impacts to current code.

It separates into presentation logic layer, business logic layer and data logic layer. The presentation logic layer is in charge of display the view to user. Business logic layer, on the other hand, uses to handle the business requirements of the application. Meanwhile, data logic layer supports store and retrieve data.

How to use it in Android development

In android development, separation of concerns can be implemented as Model View Presenter (MVP). The Model is the data logic layer, view is the presentation logic layer and presenter is the business logic layer.

Figure 1: MVP model

This image is from (Agarwal 2018)

Model

The model uses to manage how data is stored and used in the program.

View

View uses to display UI and allows users to interact with these UI components.

Presenter

Presenter stands in the middle of view and model. When users change data by interacting with the GUI, the presenter will update the model automatically.
